Islamabad.

Re: **Material Information**

Dear Sir,

This is in continuation of our letter dated March 30, 2015 whereby testing results of Shinawari and Samanasuk formations at Exploratory well Mardankhel-1 well were shared.

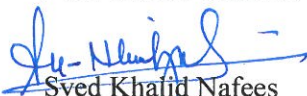

In accordance with the Listing Regulations, as per information received from MOL, the operator of TAL Block, hydrocarbons have been encountered as a result of second Drill Stem Test (DST) conducted at the Mardankhel-1 well to test the potential of Lumshiwal formation. The well has tested 2,105 barrels per day of condensate (API gravity 50) and 24.01 MMscf of gas per day at 32/64" fixed choke size at the flowing wellhead pressure of 5,018 psi.

DSTs are also planned to test the potential of Hungu and Lockhart formations and the true potential of the well shall be known after the conclusion of testing of all these formations and finalization of the completion strategy for optimum production.

A drill stem Test (DST) is a procedure for isolating and testing the surrounding geological formations through the drill stem. The test is a measurement of pressure behavior at the drill stem and is a way to obtain important fluid sampling information and to establish the probability of commercial production. Accordingly it should be borne in mind that actual production may differ significantly from the test results.

The pre-commerciality working interest of Pakistan Oilfields Limited is (25%)

Yours faithfully,
For Pakistan Oilfields Limited

Syed Khalid Nafees
Company Secretary
